

# Modal Relational Type Theory in Isabelle/HOL

Christoph E. Benzmüller and Paul E. Oppenheimer and Edward N. Zalta

June 29, 2016

## 1 Introduction

The ambitious Principia Metaphysica [5] project at Stanford University aims at providing an encompassing axiomatic foundation for metaphysics, mathematics and the sciences. The starting point is Zalta’s theory of abstract objects [6] — a metaphysical theory providing a systematic description of fundamental and complex abstract objects. This theory provides the starting point for Zalta’s ongoing ‘principia metaphysica’ project<sup>1</sup>.

The theory of abstract objects utilizes a modal relational type theory (MRTT) as logical foundation. Arguments defending this choice against a modal functional type theory (MFTT) have been presented before [7]. In a nutshell, the situation is this: functional type theory comes with strong comprehension principles, which, in the context of the theory of abstract objects, have paradoxical implications [7, chap.4]. When starting off with a relational foundation, however, weaker comprehension principles are provided, and these obstacles can be avoided. Isabelle/HOL is a proof assistant based on a functional type theory extending Church’s theory of types [4], and recently it has been shown that Church’s type theory can be elegantly utilized as a meta-logic to semantically embed and automate various quantified non-classical logics, including MFTT [1, 2]. This embedding of MFTT has subsequently been employed in a case study in computational metaphysics, in which different variants of Kurt Gödel’s ontological argument were verified resp. falsified [2, 3].

The motivating research questions for the formalisation presented below include:

- Can functional type theory, despite the problems as pointed out by Zalta and Oppenheimer [7], nevertheless be utilized to encode MRTT and subsequently the theory of abstract objects when adapting and utilizing the embeddings approach?
- From another perspective we are interested in studying options to restrict comprehension in functional type theory when utilizing the embedding approach.
- From a pragmatic point of view, we want to assess the user-friendliness of the proposed solution? To what extent can Isabelle’s user interface hide unpleasant technicalities of the extended embedding from the user?
- How far can automation be pushed in the approach? For this note that proof automation worked well for the simpler embeddings as utilized in previous work [2, 3].

---

Figure 1: Grammar of MRTT, cf. [5] for further details. Two kinds of (complex) formulas are introduced: the  $\varphi$ -formulas may have encoding subformulas, while the  $\varphi^*$ -formulas must not. The latter are designated as propositional formulas, the former ones simply as formulas.

In this contribution to the Archive of Formal Proofs we focus solely on the basic encoding of MRTT in functional type theory. The work presented here serves as the starting point for the formalization of further chapters of the theory of abstract objects and the principia metaphysica. We also leave the proper exploration and discussion of the above questions mainly to further work.

The idea we explore is to suitably extend and adapt the previous encoding of MFTT in functional type theory. The basic idea of this encoding is simple: modal logic formulas are identified with certain functional type theory formulas of predicate type  $i \Rightarrow \text{bool}$  (abbreviated as  $io$  below). Possible worlds are explicitly represented as terms of type  $i$ . A modal logic formula  $\varphi$  holds for a world  $w$  if and only if the application  $(\varphi \ w)$  evaluates to true. The definitions of the propositional modal logic connectives are straightforward. These definitions realize the well known standard translation as a set of equations in functional type theory and they successfully extend the standard translation also for quantifiers. An important aspect thereby is that quantifiers can be handled just as ordinary logical connectives. No binding mechanisms are needed, since the binding mechanism for lambda-abstractions can be fruitfully utilised.

The challenge for the work presented here has been to suitably 'restrict' this embedding for MRTT (instead of MFTT). The grammar of MRTT is presented in Figure 1. Note that this grammar successfully excludes terms such as  $(\lambda x. Rx \rightarrow xR)$ , where  $Rx$  represents exemplification of property  $R$  by  $x$  and  $xR$  stands for the encoding of property  $R$  by  $x$ . It are such kind of lambda-abstractions which lead to paradoxical situations in the theory of abstract objects [7, chap.4].

To achieve our goal we provide means to explicitly represent, maintain and propagate information on the syntactical structure of MRTT in functional type theory. In particular, we provide means in form of annotations to explicitly distinguish between propositional formulas, formulas, terms and erroneous (ineligible/excluded) formations. Respective annotation information is propagated from the innermost constituents to the top level constructions. This creates some non-trivial technical overhead. However, due to Isabelle/HOL's user interface these technicalities can be hidden from the user (to some extend).

A note on using abbreviations versus definitions in our approach: We are aware that abbreviations should be used sparsingly in Isabelle/HOL; they are automatically expanded and thus lead to a discrepancy between the internal and the external view of a term. However, we here deliberately deviate from this rule, since one aspect of the paper is to particularly illustrate exactly this discrepancy and to emphasize the complexity of the embedding MRTT in functional type theory. In fact, as we believe, this complexity makes pen and paper work with the proposed embedding pragmatically infeasible. In this sense, we agree with previous findings [7]. On the other hand, we illustrate the general feasibility, and we show, that within a modern interactive proof assistant like Isabelle/HOL the approach can eventually be handled to some modest degree. In fact, as we will also illustrate, the simplifier *simp* of Isabelle/HOL is well capable of effectively reducing the technically inflated terms we obtain from the extended embedding to their logical core content. In other words, the simplifier effectively analyses and rewrites the deeply annotated terms and propagates the annotation information as intended to top-level. It is exactly this effect which we want to emphasise and exploit here.<sup>2</sup>

## 2 Preliminaries

We start out with some type declarations and type abbreviations. Remember that our formalism explicitly encodes possible world semantics. Hence, we introduce a distinguished type  $i$  to represent the set of possible worlds. Consequently, terms of this type denote possible worlds. Moreover, modal logic formulas are associated in our approach with predicates on (resp. sets of) on possible worlds. Hence, modal logic formulas have type  $(i \Rightarrow \text{bool})$ . To make our representation more concise in the remainder we abbreviate this type as  $io$ .

**typedcl**  $i$   
**type-synonym**  $io = (i \Rightarrow \text{bool})$

Entities in the abstract theory of types are represented in our formalism by the type  $e$ . We call this the raw type of entities resp. objects. The Theory of Abstract Objects later introduces means to distinguish between abstract and ordinary entities.

**typedcl**  $e$

To explicitly model the syntactical restrictions of MRTT we introduce a (polymorphic) datatype  $'a \text{ opt}$  ( $'a$  is a type variable) based on four constructors:  $ERR\ 'a$  (identifies ineligible/excluded constructions),  $P\ 'a$  (identifies propositional formulas),  $F\ 'a$  (identifies formulas), and  $T\ 'a$  (identifies eligible terms, such as lambda abstractions). The embedding approach (of MFTT in functional type theory) is suitably adapted below so that for each language expression (in the embedded MRTT) the respective datatype is identified and appropriately propagated. The encapsulated expressions correspond to the previous embedding of MRTT in functional type theory [1, 2].

**datatype**  $'a \text{ opt} = ERR\ 'a \mid P\ 'a \mid F\ 'a \mid T\ 'a$

The following operators support a concise and elegant superscript annotation with these four syntactical categories for our language constructs.

**abbreviation**  $mkP::io \Rightarrow io \text{ opt} \ (-^P \ [109] \ 110) \ \textbf{where} \ \varphi^P \equiv P\ \varphi$

---

<sup>2</sup>We have also experimented with using definitions instead of abbreviations; the respective encodings can be requested from the authors.

**abbreviation**  $mkF::io \Rightarrow io \text{ opt } (-^F [109] \ 110)$  **where**  $\varphi^F \equiv F \ \varphi$   
**abbreviation**  $mkT::'a \Rightarrow 'a \text{ opt } (-^T [109] \ 110)$  **where**  $\varphi^T \equiv T \ \varphi$   
**abbreviation**  $mkE::'a \Rightarrow 'a \text{ opt } (-^E [109] \ 110)$  **where**  $\varphi^E \equiv ERR \ \varphi$

Certain language constructs in the Theory of Abstract objects, such as the actuality operator  $\mathcal{A}$  ("it is actually the case that"), refer to a (fixed) designated world. To model such a rigid dependence we introduce a constant symbol (name)  $dw$  of world type  $i$ . Moreover, for technical reasons, which will be clarified below, we introduce further (dummy) constant symbols for the various other domains. We anyway assume that all domains are non-empty. Hence, introducing these constant symbols is obviously not harmful. <sup>3</sup>

**consts**  $dw::i$   
**consts**  $de::e \ dio::io \ deio::e \Rightarrow io \ da::'a$

### 3 Embedding of Modal Relational Type Theory

The various language constructs of MRTT (see Figure 1) are now introduced step by step.

The actuality operator  $\mathcal{A}$ , when being applied to a formula or propositional formula  $\varphi$ , evaluates  $\varphi$  wrt the fixed given world  $dw$ . The compound expression  $\mathcal{A}\varphi$  inherits its syntactical category  $F$  (formula) or  $P$  (propositional formula) from  $\varphi$ . If the syntactical category of  $\varphi$  is  $ERR$  (error) or  $T$  (term), then the syntactical category of  $\mathcal{A}\varphi$  is  $ERR$  and a dummy entity of appropriate type is returned. This illustrates the core ideas of our explicit modeling of MRTT grammatical structure in functional type theory. This scheme will repeated below for all the other language constructs of MRTT.

**abbreviation**  $Actual::io \text{ opt } \Rightarrow io \text{ opt } (\mathcal{A} - [64] \ 65)$  **where**  $\mathcal{A}\varphi \equiv \text{case } \varphi \text{ of}$   
 $F(\psi) \Rightarrow F(\lambda w. \psi \ dw) \mid P(\psi) \Rightarrow P(\lambda w. \psi \ dw) \mid - \Rightarrow ERR(dio)$

The Theory of Abstract Objects distinguishes between encoding properties  $\kappa_1 \Pi^1$  and exemplifying properties  $\Pi^n, \kappa_1, \dots, \kappa_n$  (for  $n \geq 1$ ).

Encoding  $\kappa_1 \Pi^1$  is noted below as  $\llbracket \kappa_1, \Pi^1 \rrbracket$ . Encoding yields formulas and never propositional formulas. It is mapped to expressions of form  $(enc \ y \ Q)$ , where  $enc$  is uninterpreted constant symbol of appropriate type. Exemplification, noted below as  $\langle R^T, x^T, \dots \rangle$ , it will mapped to predicate application in the meta-logic. Thus, lambda-conversion and comprehension is automatically ensured for exemplification, but not for encoding.

**consts**  $enc::e \Rightarrow (e \Rightarrow io) \Rightarrow io$   
**abbreviation**  $Enc::e \text{ opt } \Rightarrow (e \Rightarrow io) \text{ opt } \Rightarrow io \text{ opt } (\llbracket -, - \rrbracket)$  **where**  $\llbracket x, \Phi \rrbracket \equiv \text{case } (x, \Phi) \text{ of}$   
 $(T(y), T(Q)) \Rightarrow F(enc \ y \ Q) \mid - \Rightarrow ERR(dio)$

Unary exemplifying formulas  $\Pi^1 \kappa_1$  are noted below as  $\langle \Pi^1, \kappa_1 \rangle$ . Exemplification yields propositional formulas. It is mapped to predicate application.

**abbreviation**  $Exe1::(e \Rightarrow io) \text{ opt } \Rightarrow e \text{ opt } \Rightarrow io \text{ opt } (\langle -, - \rangle)$  **where**  $\langle \Phi, x \rangle \equiv \text{case } (\Phi, x) \text{ of}$   
 $(T(Q), T(y)) \Rightarrow P(Q \ y) \mid - \Rightarrow ERR(dio)$

For pragmatical reasons we support exemplification formulas  $\Pi^n, \kappa_1, \dots, \kappa_n$  here only for  $1 \leq n \leq 3$ . In addition to the unary case above, we thus introduce two further cases.

<sup>3</sup>The single polymorphic dummy  $da::'a$ , utilized e.g. in the definition of the universal quantifier of MRTT below, actually covers already all cases. However, to avoid unnecessary type inferences we actually prefer non-polymorphic dummy elements in all those cases where we can statically determine the required type.

**abbreviation**  $Exe2::(e \Rightarrow e \Rightarrow io) \text{ opt} \Rightarrow e \text{ opt} \Rightarrow e \text{ opt} \Rightarrow io \text{ opt} \ (\llbracket -, -, - \rrbracket)$

**where**  $\llbracket \Phi, x1, x2 \rrbracket \equiv \text{case } (\Phi, x1, x2) \text{ of}$   
 $(T(Q), T(y1), T(y2)) \Rightarrow P(Q \ y1 \ y2) \mid - \Rightarrow ERR(dio)$

**abbreviation**  $Exe3::(e \Rightarrow e \Rightarrow e \Rightarrow io) \text{ opt} \Rightarrow e \text{ opt} \Rightarrow e \text{ opt} \Rightarrow e \text{ opt} \Rightarrow io \text{ opt} \ (\llbracket -, -, -, - \rrbracket)$

**where**  $\llbracket \Phi, x1, x2, x3 \rrbracket \equiv \text{case } (\Phi, x1, x2, x3) \text{ of}$   
 $(T(Q), T(y1), T(y2), T(y3)) \Rightarrow P(Q \ y1 \ y2 \ y3) \mid - \Rightarrow ERR(dio)$

Formations with negation and implication are supported for both, formulas and propositional formulas, and their embeddings are straightforward. In the case of implication, the compound formula is a propositional formula if both constituents are propositional formulas. If at least one constituent is a formula and the other one eligible, then the compound formula is a formula. In all other cases an ERR-Formula is returned.

**abbreviation**  $not::io \text{ opt} \Rightarrow io \text{ opt} \ (\neg - [58] \ 59) \text{ where } \neg \varphi \equiv \text{case } \varphi \text{ of}$

$F(\psi) \Rightarrow F(\lambda w. \neg(\psi \ w)) \mid P(\psi) \Rightarrow P(\lambda w. \neg(\psi \ w)) \mid - \Rightarrow ERR(dio)$

**abbreviation**  $implies::io \text{ opt} \Rightarrow io \text{ opt} \Rightarrow io \text{ opt} \ (\text{infixl } \rightarrow 51) \text{ where } \varphi \rightarrow \psi \equiv \text{case } (\varphi, \psi) \text{ of}$

$(P(\alpha), P(\beta)) \Rightarrow P(\lambda w. \alpha \ w \longrightarrow \beta \ w) \mid (F(\alpha), F(\beta)) \Rightarrow F(\lambda w. \alpha \ w \longrightarrow \beta \ w) \mid$

$(P(\alpha), F(\beta)) \Rightarrow F(\lambda w. \alpha \ w \longrightarrow \beta \ w) \mid (F(\alpha), P(\beta)) \Rightarrow F(\lambda w. \alpha \ w \longrightarrow \beta \ w) \mid$

$- \Rightarrow ERR(dio)$

Also universal quantification  $\forall (\lambda x. \varphi)$  (first-order and higher-order) is supported for both, formulas and propositional formulas. Following previous work, the embedding maps  $\forall (\lambda x. \varphi)$  to  $(\lambda w. \forall x. \varphi \ w)$ , where the latter  $\forall$  is the universal quantifier from the HOL meta-logic. Note that  $\forall$  is introduced as logical connective based on the existing  $\lambda$ -binder. To improve the presentation and intuitive use in the remainder we additionally introduce binder notation  $\forall x. \varphi$  as syntactic sugar for  $\forall (\lambda x. \varphi)$ .

**abbreviation**  $forall::('a \Rightarrow io \text{ opt}) \Rightarrow io \text{ opt} \ (\forall) \text{ where } \forall \Phi \equiv \text{case } (\Phi \ da) \text{ of}$

$F(-) \Rightarrow F(\lambda w. \forall x. \text{case } (\Phi \ x) \text{ of } F(\psi) \Rightarrow \psi \ w)$

$\mid P(-) \Rightarrow P(\lambda w. \forall x. \text{case } (\Phi \ x) \text{ of } P(\psi) \Rightarrow \psi \ w) \mid - \Rightarrow ERR(dio)$

**abbreviation**  $forallBinder::('a \Rightarrow io \text{ opt}) \Rightarrow io \text{ opt} \ (\text{binder } \forall [8] \ 9) \text{ where } \forall x. \varphi \equiv \forall \varphi$

The modal  $\Box$ -operator is introduced here for logic S5. Since in an equivalence class of possible worlds each world is reachable from any other world, the guarding accessibility clause in the usual definition of the  $\Box$ -operator can be omitted. This is convenient and also improves the efficiency of theorem provers, cf. [3]. In Section 7.4 we will actually demonstrate that the expected S5 properties are validated by our modeling of  $\Box$ . The  $\Box$ -operator can be applied to formulas and propositional formulas.

**abbreviation**  $box::io \text{ opt} \Rightarrow io \text{ opt} \ (\Box - [62] \ 63) \text{ where } \Box \varphi \equiv \text{case } \varphi \text{ of}$

$F(\psi) \Rightarrow F(\lambda w. \forall v. \psi \ v) \mid P(\psi) \Rightarrow P(\lambda w. \forall v. \psi \ v) \mid - \Rightarrow ERR(dio)$

n-ary lambda abstraction  $\lambda^0, \lambda, \lambda^2, \lambda^3, \dots$ , for  $n \geq 0$ , is supported in the theory of abstract objects only for propositional formulas. This way constructs such as beforehand mentioned  $(\lambda x. Rx \rightarrow xR)$  (noted here as  $(\lambda x. \llbracket R^T, x^T \rrbracket \rightarrow \llbracket x^T, R^T \rrbracket)$ ) are excluded, respectively identified as ERR-annotated terms in our framework. Their embedding is straightforward:  $\lambda^0$  is mapped to identity and  $\lambda, \lambda^2, \lambda^3, \dots$  are mapped to n-ary lambda abstractions, that is,  $\lambda(\lambda x. \varphi)$  is mapped to  $(\lambda x. \varphi)$  and  $\lambda^2(\lambda xy. \varphi)$  to  $(\lambda xy. \varphi)$ , etc. Similar to before, we support only the cases for  $n \leq 3$ . Binder notation is introduced for  $\lambda$ .<sup>4</sup>

**abbreviation**  $lam0::io \text{ opt} \Rightarrow io \text{ opt} \ (\lambda^0) \text{ where } \lambda^0 \varphi \equiv \text{case } \varphi \text{ of}$

<sup>4</sup>Unfortunately, we could not find out how suitable binder notation could be analogously provided for  $\lambda^2$  and  $\lambda^3$ .

$P(\psi) \Rightarrow P(\psi) \mid - \Rightarrow ERR \text{ dio}$   
**abbreviation**  $lam::(e \Rightarrow io \text{ opt}) \Rightarrow (e \Rightarrow io) \text{ opt } (\lambda) \text{ where } \lambda\Phi \equiv \text{case } (\Phi \text{ de}) \text{ of}$   
 $P(-) \Rightarrow T(\lambda x. \text{case } (\Phi x) \text{ of } P(\varphi) \Rightarrow \varphi) \mid - \Rightarrow ERR(\lambda x. \text{dio})$   
**abbreviation**  $lamBinder::(e \Rightarrow io \text{ opt}) \Rightarrow (e \Rightarrow io) \text{ opt } (\text{binder } \lambda [8] 9) \text{ where } \lambda x. \varphi x \equiv \lambda \varphi$   
**abbreviation**  $lam2::(e \Rightarrow e \Rightarrow io \text{ opt}) \Rightarrow (e \Rightarrow e \Rightarrow io) \text{ opt } (\lambda^2) \text{ where } \lambda^2\Phi \equiv \text{case } (\Phi \text{ de de}) \text{ of}$   
 $P(-) \Rightarrow T(\lambda x y. \text{case } (\Phi x y) \text{ of } P(\varphi) \Rightarrow \varphi) \mid - \Rightarrow ERR(\lambda x y. \text{dio})$   
**abbreviation**  $lam3::(e \Rightarrow e \Rightarrow e \Rightarrow io \text{ opt}) \Rightarrow (e \Rightarrow e \Rightarrow e \Rightarrow io) \text{ opt } (\lambda^3) \text{ where } \lambda^3\Phi \equiv \text{case } (\Phi \text{ de de de})$   
*of*  
 $P(-) \Rightarrow T(\lambda x y z. \text{case } (\Phi x y z) \text{ of } P(\varphi) \Rightarrow \varphi) \mid - \Rightarrow ERR(\lambda x y z. \text{dio})$

The theory of abstract objects supports rigid definite descriptions. Our definition maps  $\iota(\lambda x. \varphi)$  to  $(THE x. \varphi dw)$ , that is, Isabelle's inbuilt definite description operator  $THE$  is utilized and evaluation is rigidly carried out with respect to the current world denoted by  $dw$ . We again introduce binder notation for  $\iota$ .

**abbreviation**  $that::(e \Rightarrow io \text{ opt}) \Rightarrow e \text{ opt } (\iota) \text{ where } \iota\Phi \equiv \text{case } (\Phi \text{ de}) \text{ of}$   
 $F(-) \Rightarrow T(THE x. \text{case } (\Phi x) \text{ of } F \psi \Rightarrow \psi dw) \mid P(-) \Rightarrow T(THE x. \text{case } (\Phi x) \text{ of } P \psi \Rightarrow \psi dw)$   
 $\mid - \Rightarrow ERR(de)$   
**abbreviation**  $thatBinder::(e \Rightarrow io \text{ opt}) \Rightarrow e \text{ opt } (\text{binder } \iota [8] 9) \text{ where } \iota x. \varphi x \equiv \iota \varphi$

## 4 Further Logical Connectives

Further logical connectives can be defined as usual. For pragmatic reasons (e.g. to avoid further blow-up of abbreviation expansions) we prefer direct definitions in all cases.

**abbreviation**  $conj::io \text{ opt} \Rightarrow io \text{ opt} \Rightarrow io \text{ opt } (\text{infixl } \wedge 53) \text{ where } \varphi \wedge \psi \equiv \text{case } (\varphi, \psi) \text{ of}$   
 $(P(\alpha), P(\beta)) \Rightarrow P(\lambda w. \alpha w \wedge \beta w) \mid (F(\alpha), F(\beta)) \Rightarrow F(\lambda w. \alpha w \wedge \beta w) \mid$   
 $(P(\alpha), F(\beta)) \Rightarrow F(\lambda w. \alpha w \wedge \beta w) \mid (F(\alpha), P(\beta)) \Rightarrow F(\lambda w. \alpha w \wedge \beta w) \mid$   
 $- \Rightarrow ERR(dio)$

**abbreviation**  $disj::io \text{ opt} \Rightarrow io \text{ opt} \Rightarrow io \text{ opt } (\text{infixl } \vee 52) \text{ where } \varphi \vee \psi \equiv \text{case } (\varphi, \psi) \text{ of}$   
 $(P(\alpha), P(\beta)) \Rightarrow P(\lambda w. \alpha w \vee \beta w) \mid (F(\alpha), F(\beta)) \Rightarrow F(\lambda w. \alpha w \vee \beta w) \mid$   
 $(P(\alpha), F(\beta)) \Rightarrow F(\lambda w. \alpha w \vee \beta w) \mid (F(\alpha), P(\beta)) \Rightarrow F(\lambda w. \alpha w \vee \beta w) \mid$   
 $- \Rightarrow ERR(dio)$

**abbreviation**  $equiv::io \text{ opt} \Rightarrow io \text{ opt} \Rightarrow io \text{ opt } (\text{infixl } \equiv 51) \text{ where } \varphi \equiv \psi \equiv \text{case } (\varphi, \psi) \text{ of}$   
 $(P(\alpha), P(\beta)) \Rightarrow P(\lambda w. \alpha w \longleftrightarrow \beta w) \mid (F(\alpha), F(\beta)) \Rightarrow F(\lambda w. \alpha w \longleftrightarrow \beta w) \mid$   
 $(P(\alpha), F(\beta)) \Rightarrow F(\lambda w. \alpha w \longleftrightarrow \beta w) \mid (F(\alpha), P(\beta)) \Rightarrow F(\lambda w. \alpha w \longleftrightarrow \beta w) \mid$   
 $- \Rightarrow ERR(dio)$

**abbreviation**  $diamond::io \text{ opt} \Rightarrow io \text{ opt } (\Diamond - [62] 63) \text{ where } \Diamond\varphi \equiv \text{case } \varphi \text{ of}$   
 $F(\psi) \Rightarrow F(\lambda w. \exists v. \psi v) \mid P(\psi) \Rightarrow P(\lambda w. \exists v. \psi v) \mid - \Rightarrow ERR(dio)$

**abbreviation**  $exists::('a \Rightarrow io \text{ opt}) \Rightarrow io \text{ opt } (\exists) \text{ where } \exists\Phi \equiv \text{case } (\Phi da) \text{ of}$   
 $P(-) \Rightarrow P(\lambda w. \exists x. \text{case } (\Phi x) \text{ of } P \psi \Rightarrow \psi w)$   
 $\mid F(-) \Rightarrow F(\lambda w. \exists x. \text{case } (\Phi x) \text{ of } F \psi \Rightarrow \psi w) \mid - \Rightarrow ERR \text{ dio}$   
**abbreviation**  $existsBinder::('a \Rightarrow io \text{ opt}) \Rightarrow io \text{ opt } (\text{binder } \exists [8] 9) \text{ where } \exists x. \varphi x \equiv \exists \varphi$

## 5 E!, O!, A! and =E

We introduce some important further notions of the theory of abstract objects. We start out with the distinguished 1-place relation constant  $E!$  (read being concrete or concreteness).

**consts** *Exists*::( $e \Rightarrow io$ ) ( $E!$ )

Next, being ordinary is defined as being possibly concrete.

**abbreviation** *ordinaryObject*::( $e \Rightarrow io$ ) *opt* ( $O!$ ) **where**  $O! \equiv \lambda x. \Diamond(\llbracket E!^T, x^T \rrbracket)$

Being abstract is then defined as not possibly being concrete.

**abbreviation** *abstractObject*::( $e \Rightarrow io$ ) *opt* ( $A!$ ) **where**  $A! \equiv \lambda x. \neg(\Diamond(\llbracket E!^T, x^T \rrbracket))$

Finally, we introduce the identity relations  $=_E$  and  $=$  on individuals.

**abbreviation** *identityE*:: $e \Rightarrow io \Rightarrow e \Rightarrow io \Rightarrow io \Rightarrow opt$  (**infixl**  $=_E$  63) **where**  $x =_E y \equiv$   
 $(\llbracket O!, x \rrbracket \wedge \llbracket O!, y \rrbracket) \wedge \Box(\forall F. \llbracket F^T, x \rrbracket \equiv \llbracket F^T, y \rrbracket)$

**abbreviation** *identityI*:: $e \Rightarrow io \Rightarrow e \Rightarrow io \Rightarrow io \Rightarrow opt$  (**infixl**  $=$  63) **where**  $x = y \equiv$   
 $x =_E y \vee (\llbracket A!, x \rrbracket \wedge \llbracket A!, y \rrbracket) \wedge \Box(\forall F. \llbracket x, F^T \rrbracket \equiv \llbracket y, F^T \rrbracket)$

## 5.1 Identity on Relations

**abbreviation** *identityRel1*::( $(e \Rightarrow io) \Rightarrow opt$ ) $\Rightarrow((e \Rightarrow io) \Rightarrow io \Rightarrow opt$  (**infixl**  $=^1$  63)  
**where**  $F1 =^1 G1 \equiv \Box(\forall x. \llbracket x^T, F1 \rrbracket \equiv \llbracket x^T, G1 \rrbracket)$

**abbreviation** *identityRel2*::( $(e \Rightarrow e \Rightarrow io) \Rightarrow opt$ ) $\Rightarrow((e \Rightarrow e \Rightarrow io) \Rightarrow io \Rightarrow opt$  (**infixl**  $=^2$  63)  
**where**  $F2 =^2 G2 \equiv \forall x1. (\lambda y. \llbracket F2, y^T, x1^T \rrbracket) =^1 (\lambda y. \llbracket G2, y^T, x1^T \rrbracket)$   
 $\wedge (\lambda y. \llbracket F2, x1^T, y^T \rrbracket) =^1 (\lambda y. \llbracket G2, x1^T, y^T \rrbracket)$

**abbreviation** *identityRel3*::( $(e \Rightarrow e \Rightarrow e \Rightarrow io) \Rightarrow opt$ ) $\Rightarrow((e \Rightarrow e \Rightarrow e \Rightarrow io) \Rightarrow io \Rightarrow opt$  (**infixl**  $=^3$  63)  
**where**  $F3 =^3 G3 \equiv \forall x1 x2. (\lambda y. \llbracket F3, y^T, x1^T, x2^T \rrbracket) =^1 (\lambda y. \llbracket G3, y^T, x1^T, x2^T \rrbracket)$   
 $\wedge (\lambda y. \llbracket F3, x1^T, y^T, x2^T \rrbracket) =^1 (\lambda y. \llbracket G3, x1^T, y^T, x2^T \rrbracket)$   
 $\wedge (\lambda y. \llbracket F3, x1^T, x2^T, y^T \rrbracket) =^1 (\lambda y. \llbracket G3, x1^T, x2^T, y^T \rrbracket)$

**abbreviation** *equalityRel0*:: $io \Rightarrow opt \Rightarrow io \Rightarrow io \Rightarrow opt$  (**infixl**  $=^0$  63)  
**where**  $F0 =^0 G0 \equiv (\lambda y. F0) =^1 (\lambda y. G0)$

## 6 Three-Valued Meta-Logic

Our approach to rigorously distinguish between proper and improper language constructions and to explicitly maintain respective information is continued also at meta-level. For this we introduce three truth values *tt*, *ff* and *err*, representing truth, falsity and error. These values are also noted as  $\top$ ,  $\perp$  and  $*$ . We could, of course, also introduce respective logical connectives for the meta-level, but in our applications (see below) this was not yet relevant.

**datatype** *mf* = *tt* ( $\top$ ) | *ff* ( $\perp$ ) | *err* ( $*$ )

Next we define the meta-logical notions of validity, satisfiability, countersatisfiability and invalidity for our embedded modal relational type theory. Moreover, we introduce the following notations:  $[\varphi]$  (for  $\varphi$  is valid),  $[\varphi]^{sat}$  ( $\varphi$  is satisfiability),  $[\varphi]^{csat}$  ( $\varphi$  is countersatisfiability) and  $[\varphi]^{inv}$  ( $\varphi$  is invalid). Actually, so far we only use validity.

**abbreviation** *valid* ::  $io \Rightarrow mf$  ( $[-]$   $[1]$ ) **where**  $[\varphi] \equiv$  case  $\varphi$  of  
 $P(\psi) \Rightarrow$  if  $\forall w. (\psi w) \longleftrightarrow True$  then  $\top$  else  $\perp$   
 $| F(\psi) \Rightarrow$  if  $\forall w. (\psi w) \longleftrightarrow True$  then  $\top$  else  $\perp$  |  $- \Rightarrow *$

**abbreviation** *satisfiable* ::  $io \Rightarrow mf$  ( $[-]^{sat}$   $[1]$ ) **where**  $[\varphi]^{sat} \equiv$  case  $\varphi$  of  
 $P(\psi) \Rightarrow$  if  $\exists w. (\psi w) \longleftrightarrow True$  then  $\top$  else  $\perp$

$| F(\psi) \Rightarrow \text{if } \exists w.(\psi \ w) \longleftrightarrow \text{True then } \top \text{ else } \perp \mid - \Rightarrow *$   
**abbreviation** *countersatisfiable* :: *io opt*  $\Rightarrow$  *mf*  $([-]^{csat} [1])$  **where**  $[\varphi]^{csat} \equiv \text{case } \varphi \text{ of}$   
 $P(\psi) \Rightarrow \text{if } \exists w. \neg(\psi \ w) \longleftrightarrow \text{True then } \top \text{ else } \perp$   
 $| F(\psi) \Rightarrow \text{if } \exists w. \neg(\psi \ w) \longleftrightarrow \text{True then } \top \text{ else } \perp \mid - \Rightarrow *$   
**abbreviation** *invalid* :: *io opt*  $\Rightarrow$  *mf*  $([-]^{inv} [1])$  **where**  $[\varphi]^{inv} \equiv \text{case } \varphi \text{ of}$   
 $P(\psi) \Rightarrow \text{if } \forall w. \neg(\psi \ w) \longleftrightarrow \text{True then } \top \text{ else } \perp$   
 $| F(\psi) \Rightarrow \text{if } \forall w. \neg(\psi \ w) \longleftrightarrow \text{True then } \top \text{ else } \perp \mid - \Rightarrow *$

## 7 Some Basic Tests

### 7.1 Exemplification and Encoding

For the following non-theorems we indeed get countermodels by nitpick.

**lemma**  $[(\forall R. \forall x. (\langle R^T, x^T \rangle \rightarrow \langle x^T, R^T \rangle))] = \top$  **apply simp nitpick** *[expect = genuine]* **oops** — Countermodel by Nitpick

**lemma**  $[(\forall R. \forall x. \langle x^T, R^T \rangle \rightarrow (\langle R^T, x^T \rangle))] = \top$  **apply simp nitpick** *[expect = genuine]* **oops** — Countermodel by Nitpick

With the first example we also want to illustrate the inflation of representations as caused by our embedding. For this note, that the formula  $[(\forall x. (\langle R^T, x^T \rangle \rightarrow \langle x^T, R^T \rangle))] = \top$  abbreviates the actual term  $(\text{case case case } (\langle da^T, da^T \rangle \rightarrow \langle da^T, da^T \rangle) \text{ of } P \ x \Rightarrow (\lambda w. \forall x. \text{case } (\langle da^T, x^T \rangle \rightarrow \langle x^T, da^T \rangle) \text{ of } P \ \psi \Rightarrow \psi \ w)^P \mid F \ x \Rightarrow (\lambda w. \forall x. \text{case } (\langle da^T, x^T \rangle \rightarrow \langle x^T, da^T \rangle) \text{ of } F \ \psi \Rightarrow \psi \ w)^F \mid - \Rightarrow \text{dio}^E \text{ of } P \ x \Rightarrow (\lambda w. \forall x. \text{case case } (\langle x^T, da^T \rangle \rightarrow \langle da^T, x^T \rangle) \text{ of } P \ x a \Rightarrow (\lambda w. \forall x a. \text{case } (\langle x^T, x a^T \rangle \rightarrow \langle x a^T, x^T \rangle) \text{ of } P \ \psi \Rightarrow \psi \ w)^P \mid F \ x a \Rightarrow (\lambda w. \forall x a. \text{case } (\langle x^T, x a^T \rangle \rightarrow \langle x a^T, x^T \rangle) \text{ of } F \ \psi \Rightarrow \psi \ w)^F \mid - \Rightarrow \text{dio}^E \text{ of } P \ \psi \Rightarrow \psi \ w)^P \mid F \ x \Rightarrow (\lambda w. \forall x. \text{case case } (\langle x^T, da^T \rangle \rightarrow \langle da^T, x^T \rangle) \text{ of } P \ x a \Rightarrow (\lambda w. \forall x a. \text{case } (\langle x^T, x a^T \rangle \rightarrow \langle x a^T, x^T \rangle) \text{ of } P \ \psi \Rightarrow \psi \ w)^P \mid F \ x a \Rightarrow (\lambda w. \forall x a. \text{case } (\langle x^T, x a^T \rangle \rightarrow \langle x a^T, x^T \rangle) \text{ of } F \ \psi \Rightarrow \psi \ w)^F \mid - \Rightarrow \text{dio}^E \text{ of } F \ \psi \Rightarrow \psi \ w)^F \mid - \Rightarrow \text{dio}^E \text{ of } P \ \psi \Rightarrow \text{if } \forall w. \psi \ w = \text{True then } \top \text{ else } \perp \mid F \ \psi \Rightarrow \text{if } \forall w. \psi \ w = \text{True then } \top \text{ else } \perp \mid - \Rightarrow *) = \top$ . In Isabelle the inflated term is displayed in the output window when placing the mouse on the abbreviated representation. However, the simplifier is capable of evaluating the annotations and thereby reducing this inflated term again to  $\forall w \ x \ x a. \text{exe } (x \ x a) \ w \longrightarrow \text{enc } (x \ x a) \ w$  as intended; one can easily see this when placing the mouse on "simp". Below we will see that the inflated representations can easily fill several pages for abbreviated formulas which are only slightly longer than our exemple formula here. This provides evidence for the pragmatic infeasibility of the approach when using pen and paper only.

The next two statements are valid and the simplifier quickly proves this.

**lemma**  $[(\forall R. \forall x. (\langle R^T, x^T \rangle \rightarrow (\langle R^T, x^T \rangle))] = \top$  **by simp**

**lemma**  $[(\forall R. \forall x. \langle x^T, R^T \rangle \rightarrow \langle x^T, R^T \rangle)] = \top$  **by simp**

### 7.2 Verifying K Principle and Necessitation

The next two lemmata show the K principle and neccessitation holds for arbitrary formulas and arbitrary propositional formulas. We present the lemmata in both variants.

**lemma**  $[(\Box(\varphi^P \rightarrow \varphi^P)) \rightarrow (\Box\varphi^P \rightarrow \Box\varphi^P)] = \top$  **apply simp done** — K Schema

**lemma**  $[(\Box(\varphi^F \rightarrow \varphi^F)) \rightarrow (\Box\varphi^F \rightarrow \Box\varphi^F)] = \top$  **apply simp done** — K Schema

**lemma**  $[\varphi^P] = \top \longrightarrow [\Box\varphi^P] = \top$  **apply simp done** — Neccessitation

**lemma**  $[\varphi^F] = \top \longrightarrow [\Box\varphi^F] = \top$  **apply simp done** — Necessitation

### 7.3 Modal Collapse is Countersatisfiable

The modelfinder Nitpick constructs a finite countermodel to the assertion that modal collapse holds.

**lemma**  $[\varphi^F \rightarrow \Box\varphi^F] = \top$  **apply simp nitpick**  $[expect = genuine]$  **oops** — Countermodel by Nitpick

**lemma**  $[\varphi^P \rightarrow \Box\varphi^P] = \top$  **apply simp nitpick**  $[expect = genuine]$  **oops** — Countermodel by Nitpick

### 7.4 Verifying S5 Principles

The  $\Box$ -operator could have alternatively been modeled by employing an equivalence relation  $r$  in a guarding clause. This has been done in previous work. Our alternative, simpler definition of  $\Box$  above omits this clause (since all worlds are reachable from any world in an equivalence relation). The following lemmata, which check various conditions for S5, confirm that we have indeed obtain a correct modeling of S5.

**lemma**  $[\Box\varphi^P \rightarrow \varphi^P] = \top$  **apply simp done**  
**lemma**  $[\Box\varphi^F \rightarrow \varphi^F] = \top$  **apply simp done**  
**lemma**  $[\varphi^P \rightarrow \Box\Diamond\varphi^P] = \top$  **apply simp done**  
**lemma**  $[\varphi^F \rightarrow \Box\Diamond\varphi^F] = \top$  **apply simp done**  
**lemma**  $[\Box\varphi^P \rightarrow \Diamond\varphi^P] = \top$  **apply simp by auto**  
**lemma**  $[\Box\varphi^F \rightarrow \Diamond\varphi^F] = \top$  **apply simp by auto**  
**lemma**  $[\Box\varphi^P \rightarrow \Box\Box\varphi^P] = \top$  **apply simp done**  
**lemma**  $[\Box\varphi^F \rightarrow \Box\Box\varphi^F] = \top$  **apply simp done**  
**lemma**  $[\Diamond\varphi^P \rightarrow \Box\Diamond\varphi^P] = \top$  **apply simp done**  
**lemma**  $[\Diamond\varphi^F \rightarrow \Box\Diamond\varphi^F] = \top$  **apply simp done**  
**lemma**  $[\Box\Diamond\varphi^P \rightarrow \Diamond\varphi^P] = \top$  **apply simp done** — 5 Schema  
**lemma**  $[\Box\Diamond\varphi^F \rightarrow \Diamond\varphi^F] = \top$  **apply simp done** — 5 Schema  
**lemma**  $[\Diamond\Box\varphi^P \rightarrow \Diamond\varphi^P] = \top$  **apply simp by auto**  
**lemma**  $[\Diamond\Box\varphi^F \rightarrow \Diamond\varphi^F] = \top$  **apply simp by auto**  
**lemma**  $[\Box\Diamond\varphi^P \rightarrow \Box\varphi^P] = \top$  **apply simp nitpick oops** — Countermodel by Nitpick  
**lemma**  $[\Box\Diamond\varphi^F \rightarrow \Box\varphi^F] = \top$  **apply simp nitpick oops** — Countermodel by Nitpick  
**lemma**  $[\Diamond\Box\varphi^P \rightarrow \Box\varphi^P] = \top$  **apply simp done**  
**lemma**  $[\Diamond\Box\varphi^F \rightarrow \Box\varphi^F] = \top$  **apply simp done**

### 7.5 Instances of the Barcan and Converse Formulas

**lemma**  $[(\forall x. \Box\{x^T, \varphi^T\}) \rightarrow \Box(\forall x. \{x^T, \varphi^T\})] = \top$  **apply simp done**

**lemma**  $[(\forall x. \Box\{\varphi^T, x^T\}) \rightarrow \Box(\forall x. \{\varphi^T, x^T\})] = \top$  **apply simp done**

**lemma**  $[(\forall x. \Box(\forall x. \{x^T, \varphi^T\}) \rightarrow \Box\{x^T, \varphi^T\})] = \top$  **apply simp by auto**

**lemma**  $[\Box(\forall x. \{\varphi^T, x^T\}) \rightarrow (\forall x. \Box\{\varphi^T, x^T\})] = \top$  **apply simp by auto**

### 7.6 Relations between Meta-Logical Notions

We check some well know relations between meta-logical notions.

**lemma**  $[\varphi^P] = \top \longleftrightarrow [\varphi^P]^{csat} = \perp$  **apply simp done**

**lemma**  $[\varphi^P]^{sat} = \top \longleftrightarrow [\varphi^P]^{inv} = \perp$  **apply simp done**

**lemma**  $[\varphi^F] = \top \longleftrightarrow [\varphi^F]^{csat} = \perp$  **apply simp done**

**lemma**  $[\varphi^F]^{sat} = \top \longleftrightarrow [\varphi^F]^{inv} = \perp$  **apply simp done**

However, for terms we have:

**lemma**  $[\varphi^T] = *$  **apply simp done**  
**lemma**  $[\varphi^T]^{sat} = *$  **apply simp done**  
**lemma**  $[\varphi^T]^{csat} = *$  **apply simp done**  
**lemma**  $[\varphi^T]^{inv} = *$  **apply simp done**

## 7.7 Propagation of Grammatical Information

The expression  $(\lambda x. \exists F. \llbracket x^T, F^T \rrbracket \wedge \neg \llbracket F^T, x^T \rrbracket)$  is an ineligible construct, cf. [7, chap.4]. When placing the mouse on 'simp' we see that this is evaluated to  $(\lambda x. dio)^E$  as intended, i.e. an ERR-term is returned.

**lemma**  $(\lambda x. \exists F. \llbracket x^T, F^T \rrbracket \wedge \neg \llbracket F^T, x^T \rrbracket) = X$  **apply simp oops** — X is  $(\lambda x. dio)^E$

Similarly, the following comprehension principle for abstract objects is an ineligible formula, cf. [7, chap.4]. The simplifier quickly proves that this formula  $(\exists x. (\llbracket A!, x^T \rrbracket \wedge (\forall F. (\llbracket x^T, F^T \rrbracket \equiv (F^T =^1 K))))$  is equal to  $*$ . That is, the evaluation of this formula returns the *err* truth value for error.

**abbreviation**  $K$  **where**  $K \equiv (\lambda x. \exists F. \llbracket x^T, F^T \rrbracket \wedge \neg \llbracket F^T, x^T \rrbracket)$

**lemma**  $[(\exists x. (\llbracket A!, x^T \rrbracket \wedge (\forall F. (\llbracket x^T, F^T \rrbracket \equiv (F^T =^1 K))))] = *$  **apply simp done**

We also use the latter formula to further illustrate the technical overhead of our embedding. For this see Figure 2, which displays approx. 5 percent of the unfolded representation of our formula. It should thus be obvious that pen and paper work with the embedding as proposed here is completely infeasible.

## 8 Some Further Tests

In this section we present some unstructured further test examples of our encoding.

We show that the derivation from  $(\llbracket a^T, PP^T \rrbracket \wedge \neg \llbracket PP^T, a^T \rrbracket)$  to  $(\exists F. \llbracket a^T, F^T \rrbracket \wedge \neg \llbracket F^T, a^T \rrbracket)$  can in fact be represented and solved in our approach, cf. [7, chap.4]

**lemma**  $[(\llbracket a^T, PP^T \rrbracket \wedge \neg \llbracket PP^T, a^T \rrbracket)] = \top \longrightarrow [(\exists F. \llbracket a^T, F^T \rrbracket \wedge \neg \llbracket F^T, a^T \rrbracket)] = \top$  **apply simp by auto**

Properties of Equality

**lemma**  $[(\forall x. x^T = x^T)] = \top$  **apply simp by auto**  
**lemma**  $[(\forall x y. x^T = y^T \rightarrow y^T = x^T)] = \top$  **apply simp by meson**  
**lemma**  $[(\forall x y z. (x^T = y^T \wedge y^T = z^T) \rightarrow x^T = z^T)] = \top$  **apply simp by meson**  
**lemma**  $[(\forall x y. x^T = y^T \rightarrow \Box(x^T = y^T))] = \top$  **apply simp done**

**lemma**  $[(\forall x. \llbracket O!, x^T \rrbracket \rightarrow x^T =_E x^T)] = \top$  **apply simp done**  
**lemma**  $[(\forall x y. x^T =_E y^T \rightarrow y^T =_E x^T)] = \top$  **apply simp by meson**  
**lemma**  $[(\forall x y z. (x^T =_E y^T \wedge y^T =_E z^T) \rightarrow x^T =_E z^T)] = \top$  **apply simp by meson**  
**lemma**  $[(\forall x y. x^T =_E y^T \rightarrow \Box(x^T =_E y^T))] = \top$  **apply simp done**

**lemma**  $[(\forall x. x^P =^0 x^P)] = \top$  **apply simp done**

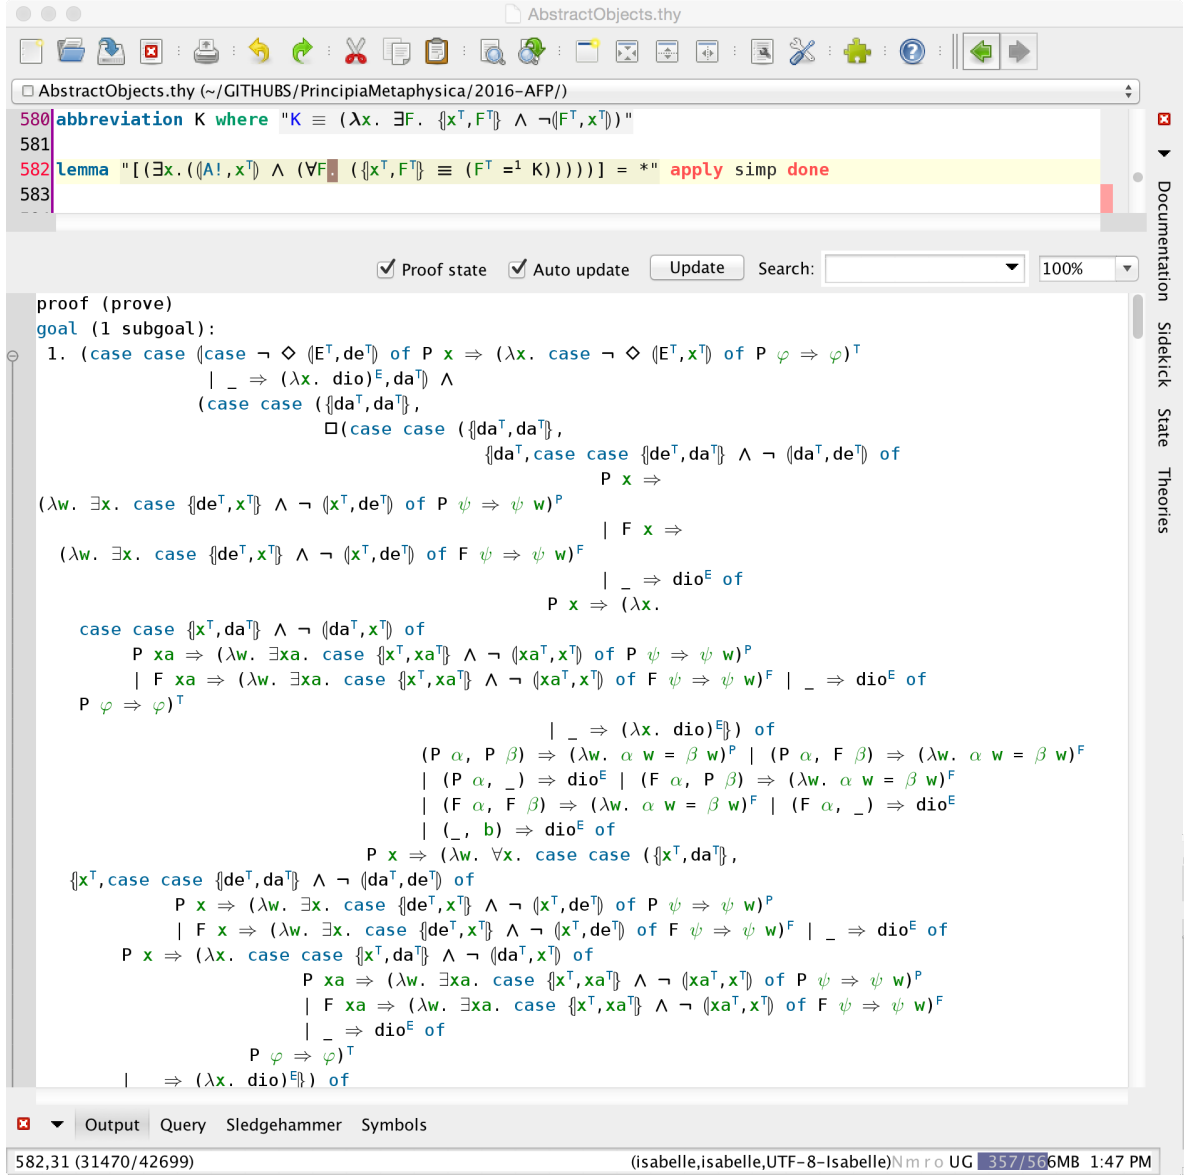

Figure 2: Display (5 percent) of the unfolded expression  $[(\exists x. ((A!, x^T) \wedge (\forall F. (\{x^T, F^T\} \equiv (F^T =^1 K)))))] = *$  in Isabelle/HOL.

**lemma**  $[(\forall x y. x^P =^0 y^P \rightarrow y^P =^0 x^P)] = \top$  **apply simp done**  
**lemma**  $[(\forall x y z. (x^P =^0 y^P \wedge y^P =^0 z^P) \rightarrow x^P =^0 z^P)] = \top$  **apply simp done**  
**lemma**  $[(\forall x y. x^P =^0 y^P \rightarrow \Box(x^P =^0 y^P))] = \top$  **apply simp done**  
  
**lemma**  $[(\forall x. x^P =^0 x^P)] = \top$  **apply simp done**  
**lemma**  $[(\forall x y. x^P =^0 y^P \rightarrow y^P =^0 x^P)] = \top$  **apply simp done**  
**lemma**  $[(\forall x y z. (x^P =^0 y^P \wedge y^P =^0 z^P) \rightarrow x^P =^0 z^P)] = \top$  **apply simp done**  
**lemma**  $[(\forall x y. x^P =^0 y^P \rightarrow \Box(x^P =^0 y^P))] = \top$  **apply simp done**  
  
**lemma**  $[(\forall x. x^T =^1 x^T)] = \top$  **apply simp done**  
**lemma**  $[(\forall x y. x^T =^1 y^T \rightarrow y^T =^1 x^T)] = \top$  **apply simp done**  
**lemma**  $[(\forall x y z. (x^T =^1 y^T \wedge y^T =^1 z^T) \rightarrow x^T =^1 z^T)] = \top$  **apply simp done**  
**lemma**  $[(\forall x y. x^T =^1 y^T \rightarrow \Box(x^T =^1 y^T))] = \top$  **apply simp done**  
  
**lemma**  $[(\forall x. x^T =^2 x^T)] = \top$  **apply simp done**  
**lemma**  $[(\forall x y. x^T =^2 y^T \rightarrow y^T =^2 x^T)] = \top$  **apply simp done**  
**lemma**  $[(\forall x y z. (x^T =^2 y^T \wedge y^T =^2 z^T) \rightarrow x^T =^2 z^T)] = \top$  **apply simp done**  
**lemma**  $[(\forall x y. x^T =^2 y^T \rightarrow \Box(x^T =^2 y^T))] = \top$  **apply simp done**  
  
**lemma**  $[(\forall x. x^T =^3 x^T)] = \top$  **apply simp done**  
**lemma**  $[(\forall x y. x^T =^3 y^T \rightarrow y^T =^3 x^T)] = \top$  **apply simp done**  
**lemma**  $[(\forall x y z. (x^T =^3 y^T \wedge y^T =^3 z^T) \rightarrow x^T =^3 z^T)] = \top$  **apply simp done**  
  
**lemma**  $[(\forall x y. x^T =^3 y^T \rightarrow \Box(x^T =^3 y^T))] = \top$  **apply simp done**

## 9 Some Tests with Comprehension

**lemma**  $[(\exists x. (\llbracket A! \rrbracket^{x^T} \wedge (\forall F. (\llbracket x^T, F^T \rrbracket \equiv \llbracket F^T, x^T \rrbracket)))] = \top$  **apply simp oops**

## 10 Some Further Tests (Largely Uncommented)

**lemma**  $[(\forall x. \llbracket x^T, PP^T \rrbracket)] = \top \longrightarrow [(\llbracket a^T, PP^T \rrbracket)] = \top$  **apply simp done**
